UNETsystem, Ubiquitous Network Security Company
Realtime Firewall Log Analysis Solution Anymon FWL Acquired GS Certification
- Focus on Governments, Finances, and Large Enterprises -

UNETsystem, a leading ubiquitous network security company announced that realtime firewall log analysis solution Anymon FWL acquired GS Certification, which is certified Good Software officially.

GS is an official certification that guarantees quality of software by field testing over than eighty categories from TTA, Telecommunication Technology Association in Korea. Through this certification, Anymon FWL officially guaranteed its suitability, interoperability, security, reliability, usability, efficiency, maintainability and graft ability as a realtime firewall log analysis solution.

Anymon FWL is a realtime firewall log analysis solution that analyzes traffic coming from firewall systems deployed at diverse locations. This solution enables early detections and counteractions against various types of security threats such as malicious traffics by collecting, storing, analyzing, and searching logs from firewall systems, and supports systematic security policy building to provide diverse firewall statistics and reports.

The most important feature of Anymon FWL is its performance. The built-in ultrahigh-speed searching engine that searches log at 500 Mbytes per second rate can analyze maximum a billion of log per day. Large enterprise companies such as Samsung Group, Samsung Electronics, SK telecom, and Lotte Data Communication Company, which had been using Anymon FWL, detect malicious traffics on realtime basis without any difficulties.

Security solution business of UNETsystem would be accelerated by this certification.

The CEO of UNETsystem, Jong heon Sim said that, "Anymon FWL is an only choice to overcome traditional network security system". And also said, "We will lead the domestic firewall log analysis market by focusing on governments, finances, and large Enterprises from this certification".

UNETsystem will promote its business at large ESM sites in terms of advancement and compensation controls.
